

Empathy Map Canvas

Ideation Phase | Import Data Using Transform Maps

1. Target User

Persona: Priya, a ServiceNow administrator at a mid-sized company. She receives monthly employee and asset files from HR and IT and must load them into ServiceNow tables with accurate values and no duplicates.

2. Empathy Map Canvas

SAYS • "I spent the whole afternoon fixing this spreadsheet." • "Why are there two records for the same user?" • "Which column goes to which field?" • "Can we just load it again?"	THINKS • Is the data accurate enough to trust? • Did I overwrite good records? • There must be a faster way than copy-paste. • If this fails, reports will be wrong.
DOES • Opens CSV/Excel files and edits values by hand • Uploads files and checks table lists manually • Deletes duplicates after the fact • Asks colleagues how Transform Maps work	FEELS • Frustrated by repetitive work • Anxious about data errors • Confused by import set and transform terms • Relieved when an import runs cleanly

3. Pains

- Inconsistent column names and formats in each source file.
- Duplicate records after repeated uploads.
- Reference fields (department, location, manager) failing to match.
- No clear error messages when rows are rejected.
- Fear of loading bad data into production.

4. Gains

- A one-time mapping that can be reused for every future file.
- Automatic matching of existing records through coalesce.
- Clear counts of inserted, updated and ignored rows.
- Confidence that data is correct and traceable.

5. Insights from the Empathy Map

Insight	Design implication
Users fear duplicates most	Make coalesce setup a core part of the solution
Mapping is the confusing step	Provide a clear field-mapping table and auto-map where possible
Errors are found late	Review transform history right after each run
Work is repeated every month	Reuse the same data source and transform map
