

Idea Prioritization

Ideation Phase | Import Data Using Transform Maps

1. Prioritisation Method

Each idea from brainstorming was scored from 1 to 5 on **Impact** (value to data quality and time saved), **Effort** (5 = lowest effort) and **Feasibility** (can be built on a standard ServiceNow instance). The total is out of 15.

2. Scoring Table

Idea	Impact	Effort (low=5)	Feasibility	Total
Import set + Transform Map (core)	5	4	5	14
Coalesce on unique field	5	5	5	15
Field map and reference lookup	4	4	5	13
onBefore validation script	4	3	4	11
Transform history review	4	5	5	14
Scheduled imports from data source	4	3	3	10
Web service import sets	3	2	3	8
Data template for data owners	3	5	5	13

3. Priority Matrix (Impact vs Effort)

	Low effort	High effort
High impact	Do first: Coalesce, Import set + Transform Map, Transform history review, Field maps	Plan next: Scheduled imports, validation scripts
Low / medium impact	Quick wins: Data template for data owners	Later: Web service import sets

4. Selected Ideas for the Project

- **Must have:** Data source and import set staging, Transform Map with field maps, coalesce on unique field.
- **Should have:** Reference lookups, field map scripts, onBefore validation, transform history review.
- **Could have:** Standard data template, scheduled import.
- **Out of scope:** Web service import sets (future phase).

5. Rationale

The core Transform Map approach scores highest because it is built into ServiceNow, needs no extra licences, and directly solves duplicates, mapping errors and missing audit trail. Coalescing and log review add the largest quality gain for very little effort, so they are treated as mandatory.
