

Use Cases and Scenarios

Ideation Phase | Import Data Using Transform Maps

1. Overview

The following scenarios show where importing data with Transform Maps adds value. Each uses the same pattern: source file, staging table, transform map, target table.

2. Use Case Summary

ID	Use case	Target table	Coalesce field
UC-01	Bulk user onboarding	sys_user	email / user_name
UC-02	CMDB asset import	cmdb_ci_computer	serial_number
UC-03	Legacy incident migration	incident	correlation_id
UC-04	Location / department load	cmn_location / cmn_department	name
UC-05	Custom table data load	u_custom_table	unique business key

3. UC-01: Bulk User Onboarding

- **Actor:** Administrator.
- **Trigger:** HR sends a file of new joiners.
- **Flow:** upload file, create import set, map first name, last name, email, department, manager, then transform.
- **Rules:** coalesce on email; department and manager use reference lookups; skip rows without email.
- **Outcome:** user records created or updated, ready for role assignment.

4. UC-02: CMDB Asset Import

- **Actor:** IT asset manager.
- **Trigger:** Inventory tool exports servers and laptops.
- **Flow:** load inventory file, map name, serial number, OS, location, assigned user.
- **Rules:** coalesce on serial number so re-imports update details instead of duplicating assets.
- **Outcome:** accurate configuration items for incident and change management.

5. UC-03: Legacy Incident Migration

- **Actor:** Developer.
- **Trigger:** Move from an old ticketing tool.
- **Flow:** export tickets, map number, short description, priority, state, caller.
- **Rules:** field map scripts convert old priority and state values to ServiceNow choice values.
- **Outcome:** historical tickets available for search and reporting.

6. UC-04 and UC-05: Reference and Custom Data

Locations, departments and other reference data are loaded first so they exist before user and asset imports that depend on them. Custom application tables use the same method with a business key as the coalesce field.

7. Sample Scenario Walkthrough

Step	Action	Expected result
1	Upload users.xlsx to a data source	File read, header row detected
2	Load data into import set table	20 rows in staging
3	Run transform with coalesce on email	15 inserted, 4 updated, 1 ignored (no email)
4	Open Transform History	Counts match; ignored row listed with reason
5	Re-run the same file	0 inserted, 19 updated: no duplicates

8. Benefits Across Use Cases

- Consistent method for all data types.
- Less manual work and fewer errors.
- Reusable maps for recurring loads.
- Complete traceability of every import.
