

Data Model and Field Mapping Design

Project Design Phase | Import Data Using Transform Maps

1. Data Model Overview

Two table groups are involved: the **import set (staging) table**, which mirrors the file columns as text fields, and the **target table**, which has typed fields, references and choices. The Transform Map connects them.

2. Staging Table Design (u_import_users)

Field	Type	Source column	Note
u_first_name	String (40)	First Name	Required
u_last_name	String (40)	Last Name	Required
u_email	String (100)	Email	Unique key
u_department	String (100)	Department	Name of department
u_manager	String (100)	Manager	Manager email
u_title	String (100)	Title	Optional
u_phone	String (40)	Phone	Optional
u_status	String (20)	Status	Active / Inactive
sys_import_set	Reference	(system)	Links row to import set
sys_import_state	String	(system)	Pending / Inserted / Updated / Ignored / Error

3. Target Table Design (sys_user)

Field	Type	Constraint
first_name	String	Required
last_name	String	Required
email	String	Unique (coalesce)
department	Reference (cmn_department)	Must exist
manager	Reference (sys_user)	Must exist
title	String	Optional
phone	String	Optional
active	True/False	Default true

4. Field Mapping Design

Source (staging)	Target	Method	Coalesce
u_first_name	first_name	Direct	No
u_last_name	last_name	Direct	No
u_email	email	Direct	Yes
u_department	department	Reference lookup on Name	No
u_manager	manager	Reference lookup on Email	No
u_title	title	Direct	No
u_phone	phone	Direct	No
u_status	active	Script: Active = true	No

5. Data Type Handling

Data type	Handling
Text	Direct mapping; trim spaces in script when needed
Reference	Match by name or key; skip row if not found
Choice	Map to existing values; use choice action if new ones are allowed
Boolean	Convert Yes/No or Active/Inactive using a script
Date	Use consistent source format (YYYY-MM-DD); convert in script if different
