

Data Source and Import Set Creation

Project Development Phase | Import Data Using Transform Maps

1. Objective

Create the data source and load the source file into an import set (staging) table so that raw data is available for transformation.

2. Steps to Load the Data

Step	Navigation / action	Settings
1	System Import Sets > Load Data	Opens the Load Data form
2	Import set table	Choose Create table
3	Label	Import Users
4	Name	u_import_users (auto-generated with u_ prefix)
5	Source of the import	File
6	Type of data	Excel (.xlsx)
7	File	Choose users_valid.xlsx
8	Sheet number	1
9	Header row	1
10	Click Submit	Data loaded into the staging table

3. Result of the Load

Check	Expected	Observed (sample)
Staging table created	u_import_users	u_import_users
Row count	Same as file (10)	10 rows
Columns created	8 fields (u_first_name ... u_status)	8 fields
Import set state	Loaded	Loaded

4. Staging Table Columns Created

Source header	Staging field	Type
First Name	u_first_name	String
Last Name	u_last_name	String
Email	u_email	String
Department	u_department	String
Manager	u_manager	String

Source header	Staging field	Type
Title	u_title	String
Phone	u_phone	String
Status	u_status	String

5. Verification

- Open System Import Sets > Import Sets and confirm one new import set with state Loaded.
- Open the table u_import_users.list and compare the first and last rows with the file.
- Check that no row has shifted columns (a sign of a wrong header row setting).

6. Issues and Fixes

Issue	Cause	Fix
Fields named field1, field2	Header row set to 0 or wrong	Set header row to 1 and reload
Zero rows loaded	Wrong sheet number	Set the correct sheet number
Garbled characters	File not saved as UTF-8 (CSV)	Re-save as UTF-8 or use XLSX
