

Transform Map and Field Mapping

Project Development Phase | Import Data Using Transform Maps

1. Objective

Create a Transform Map that connects the staging table u_import_users to the target table sys_user and define how each field is mapped.

2. Steps to Create the Transform Map

Step	Action	Setting
1	From the loaded import set, click Create Transform Map (or System Import Sets > Transform Maps > New)	
2	Name	Import Users Map
3	Source table	Import Users [u_import_users]
4	Target table	User [sys_user]
5	Run business rules	Unchecked for the bulk load
6	Enforce mandatory fields	All (or Only UI as required)
7	Copy empty fields	Unchecked
8	Click Submit / Save	Transform Map created
9	In Related Links, choose Auto Map Matching Fields	Fields with matching names mapped
10	Open Mapping Assist for remaining fields	Map manually

3. Field Map Configuration

Source field	Target field	Coalesce	Special setting
u_first_name	first_name	No	Direct
u_last_name	last_name	No	Direct
u_email	email	Yes	Direct; coalesce on this field
u_department	department	No	Reference value field name: name
u_manager	manager	No	Reference value field name: email
u_title	title	No	Direct
u_phone	phone	No	Direct
u_status	active	No	Use source script (see Scripts document)

4. Setting the Coalesce Field

- Open the field map for u_email to email.
- Check **Coalesce**.

- Leave 'Coalesce empty fields' unchecked so blank emails never match records.
- Save the field map.

5. Reference Field Handling

For **department** and **manager**, the Reference value field name tells ServiceNow which field of the referenced table to match. Department values are matched against cmn_department.name, and manager values against sys_user.email. If no match exists, the reference stays empty and a warning is logged by the script.

6. Verification Checklist

Check	Done
Transform Map active and linked to correct tables	Yes
8 field maps listed in the related list	Yes
Exactly one field map with Coalesce checked	Yes
Reference value field names set for department and manager	Yes
