

Import Execution and Verification

Project Development Phase | Import Data Using Transform Maps

1. Objective

Run the transform, verify the records in the target table, and confirm that repeat loads do not create duplicates.

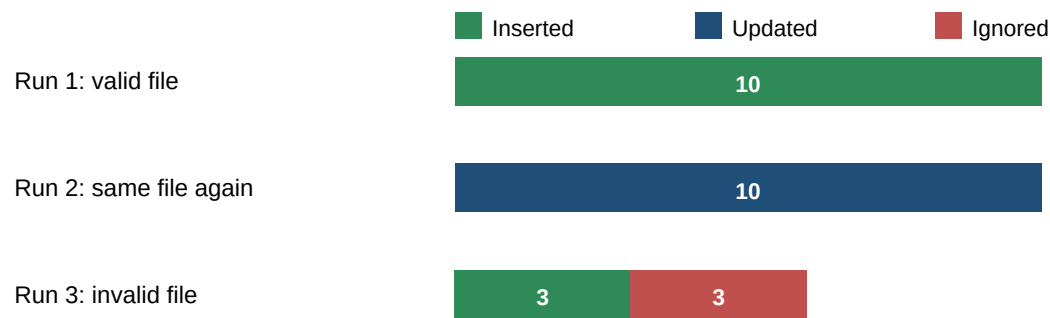

The counts below are sample results that match the sample files in this project. Replace them with the actual numbers shown in your Transform History.

2. Steps to Run the Transform

Step	Action
1	Open the import set (System Import Sets > Import Sets) for the loaded file
2	Click Transform (or Run Transform) and select 'Import Users Map'
3	Wait for the Transform Complete message
4	Open System Import Sets > Transform History
5	Open the latest record and review inserted, updated, ignored and error counts
6	Open sys_user.list and filter by the imported emails

3. Execution Results (sample)

Run	File	Inserted	Updated	Ignored	Errors
1	users_valid.xlsx (10 rows)	10	0	0	0
2	users_duplicate.xlsx (same 10 rows)	0	10	0	0
3	users_invalid.xlsx (6 rows)	3	0	3	0

4. Data Verification (sample comparison)

Email	Source status	Target active	Department in target	Match
anita.kumar@example.com	Active	true	IT	Yes
ravi.s@example.com	Active	true	IT	Yes
meena.iyer@example.com	Active	true	HR	Yes

Email	Source status	Target active	Department in target	Match
karthik.raj@example.com	Inactive	false	Finance	Yes

5. Duplicate Check

After Run 2, the query `sys_user where email = anita.kumar@example.com` returns one record. The second load updated the existing record, confirming that coalesce on email prevents duplicates.

6. Log Review

Log message	Meaning
Row skipped: missing email	Row ignored by onBefore
No department supplied for ...	Warning only; row saved without department
Inserted user: ...	New record created
Updated user: ...	Existing record updated through coalesce
