

Project Report

Project Documentation | Import Data Using Transform Maps

1. Abstract

Organisations often need to bring data from spreadsheets and other systems into ServiceNow. Doing this by hand causes duplicates, wrong values and no audit trail. This project designs, builds and tests a repeatable import process using ServiceNow **Import Sets** and **Transform Maps**. Source files are loaded into a staging table, mapped to the target table with field maps, scripts and reference lookups, matched on a unique **coalesce** field, and verified in Transform History.

2. Introduction

ServiceNow stores data in tables, but external data seldom matches their structure. An import set holds the raw data, and a Transform Map describes how each source field becomes a target field. Together they give a controlled way to load data in bulk.

3. Problem Statement

Manual loading of external data into ServiceNow is slow and error-prone. It creates duplicate records, inconsistent values and missing references, and leaves no record of what was loaded.

4. Objectives

- Load CSV/Excel data into ServiceNow tables accurately.
- Prevent duplicates using a coalesce field.
- Convert and validate values with transform scripts.
- Log every run and rejected row for audit.
- Create a reusable process for future files.

5. Methodology

Phase	Work done	Output
Ideation	Problem definition, empathy map, brainstorming, prioritisation	Chosen idea and use cases
Requirement analysis	Journey map, functional and non-functional requirements, data flow	Requirement baseline
Design	Architecture, data model, transform logic, process flow	Approved design
Planning	Schedule, resources, risks, test and deployment plans	Project plan
Development	Data source, import set, Transform Map, scripts, execution	Working solution
Documentation	Report, guides, demo and lessons learned	Final documents

6. System Overview

7. Implementation Summary

Component	Implementation
Staging table	u_import_users created from the file headers
Target table	User [sys_user]
Transform Map	Import Users Map with 8 field maps
Coalesce	email field
Reference lookups	Department by name, manager by email
Scripts	onStart, onBefore, field map (status), onAfter, onComplete

8. Results

Results below are sample outcomes for the project's sample files. Replace with your actual figures.

Measure	Result
Valid file (10 rows)	10 inserted
Same file loaded again	0 inserted, 10 updated, no duplicates
File with invalid rows (6 rows)	3 inserted, 3 ignored and logged
Test cases	12 of 12 passed
Defects found and fixed	5

9. Conclusion

The project shows that Transform Maps provide a reliable, repeatable and auditable way to import data into ServiceNow. The design prevents duplicates, handles bad data safely, and can be reused for other tables and files.
