

Troubleshooting Guide and FAQ

Project Documentation | Import Data Using Transform Maps

1. Troubleshooting Guide

Problem	Likely cause	Solution
Columns named field1, field2	Header row setting wrong	Set Header row to 1 and reload
No rows loaded	Wrong sheet number or empty sheet	Set correct sheet number; check file
Duplicate users created	Coalesce not set, or email differs by case/space	Tick Coalesce on email; trim and lower-case in onBefore
Manager or department blank	Reference value field name not set, or value missing	Set reference field (name / email); load reference data first
All users inactive	Status has extra spaces or different wording	Trim and lower-case status in script
Rows ignored	onBefore skipping rows with missing data	Check Import Log; fix the source rows
Transform runs but target unchanged	Wrong target table or no field maps	Check map's target table and Field Maps list
Access denied on Load Data	Missing role	Ask admin to grant import_transformer
Timeout on large file	Too many rows in one run	Split into smaller files
Garbled characters	Wrong file encoding	Save CSV as UTF-8 or use XLSX

2. Where to Look

Need	Location
Counts for a run	System Import Sets > Transform History
Row-level messages	System Import Sets > Import Logs; System Logs > All
Raw loaded data	u_import_users.list
Final data	sys_user.list

3. Frequently Asked Questions

Question	Answer
What is an import set?	A staging table that holds raw file data before it is transformed into the target table.
What is a Transform Map?	A set of rules that maps staging fields to target fields.

Question	Answer
What is coalesce?	A field used to match existing records so they are updated instead of duplicated.
Can I use the same map again?	Yes, if the file layout is unchanged; load the new file into the same table and run the map.
What happens to bad rows?	The onBefore script ignores them and logs a reason; other rows continue.
Can I undo an import?	Not automatically. Filter by the import set to find inserted records, or fix the file and reload with the same key.
Do I need to code?	Direct mappings need none. Scripts are needed only for cleaning and conversion.
Why test in sub-production?	Imports change many records at once, so mistakes are costly in production.
