

Data Flow Diagram and User Stories

Requirement Analysis | Import Data Using Transform Maps

1. Data Flow Diagram (Level 1)

Flow: file is staged, transformed, matched on the coalesce key, saved to the target table and logged.

2. Data Flow Description

Step	From	To	Data
1	Data owner	Data source	CSV/XLSX file
2	Data source	Import set table	Raw rows (staging)
3	Import set table	Transform map	Source field values
4	Transform map	Coalesce check	Mapped and cleaned values
5	Coalesce check	Target table	Insert new / update existing record
6	Transform	Transform history	Inserted, updated, ignored, error counts
7	Transform history	Administrator	Results and error messages

3. User Stories

ID	As a...	I want to...	So that...	Priority
US-01	Administrator	upload a file as a data source	data can be loaded without manual typing	High
US-02	Administrator	map source columns to target fields	values land in the correct fields	High
US-03	Administrator	set a coalesce field	re-loading does not create duplicates	High
US-04	Administrator	convert values with a script	source values match ServiceNow formats	Medium

ID	As a...	I want to...	So that...	Priority
US-05	Administrator	skip rows with missing data	bad rows do not enter the table	Medium
US-06	Administrator	review transform history	I can verify and fix errors quickly	High
US-07	Data owner	use a standard file template	my files load without rework	Medium
US-08	Manager	trust the imported data	reports and dashboards are accurate	High
