

Technology Stack

Requirement Analysis | Import Data Using Transform Maps

1. Overview

The solution uses only built-in ServiceNow capabilities, so no external software is needed beyond a spreadsheet tool to prepare the source file.

2. Technology Stack

Layer	Technology / feature	Purpose
Platform	ServiceNow (Personal Developer Instance)	Hosts tables, import sets and transform maps
Source data	CSV, XLS, XLSX files	External data to be imported
File preparation	Microsoft Excel / Google Sheets	Prepare and check files before upload
Data source	Data Source record (File type)	Defines how the file is read
Staging	Import Set table (u_ prefix)	Temporary storage of raw rows
Transformation	Transform Map, Field Maps	Maps staging fields to target fields
Scripting	JavaScript (server-side) in field map, onBefore, onAfter scripts	Cleaning, conversion, validation
Target	sys_user, incident, cmdb_ci or custom table	Final storage of data
Monitoring	Transform History, Import Log, System Logs	Verify results, find errors
Security	Roles: admin, import_transformer; ACLs	Control who can import

3. ServiceNow Modules Used

Module	Path
Load Data	System Import Sets > Load Data
Data Sources	System Import Sets > Administration > Data Sources
Transform Maps	System Import Sets > Transform Maps
Import Sets	System Import Sets > Import Sets
Transform History	System Import Sets > Transform History
Import Log	System Import Sets > Import Logs

4. Technology Selection Rationale

- **Built-in features:** no licences or plugins required.
- **JavaScript:** the standard scripting language across ServiceNow.
- **Import Sets:** separate raw data from final tables, so mistakes do not corrupt live tables.

- **PDI:** free for learning and safe for testing.

5. Alternatives Considered

Option	Why not chosen
Manual entry or list import	No transformation or coalesce control
Integration Hub / ETL	More setup than needed for file-based imports
Web service import sets	Planned for a later phase
